

SPPU-TE-COMP-CONTENT – KSKA Git

Q1. Discuss different types of temperature sensors available.

Ans. Types of sensors include:-

1. Thermocouples :-

- These sensors measure voltage changes to determine temperature.
- They are often used in industrial settings, such as in furnaces, kilns and boilers.

2. Resistance temperature detectors (RTD's) :-

- These sensors measure temperature by correlating the resistance of the RTD element with temperature.
- RTD's are considered the most accurate and stable temperature sensors.

3. Thermistors :-

- These sensors are sensitive to small temperature variations.
- They have high resistance at low temperatures, which decreases as the temperature rises.

4. Non-contact sensors :-

- These sensors detect changes in physical environmental conditions without ~~to~~ physical contact with the measured object.

5. Infrared sensors :-

- These sensors sense a variety of characteristics in their surroundings.

Q2. What is the working principle of DHT11 sensor

including capturing moisture and temperature?

Ans.

→ Working principle:-

- The DHT11 is a basic, ultra low-cost digital temperature and humidity sensor.
- It uses a capacitive humidity sensor and the atmosphere to measure the surrounding air, and spits out a digital signal on the data pin (no ~~analog~~ analog input pins needed).
- It is fairly simple to use, but requires careful timing to grab data.
- You can get new data from it once every 2 seconds, so when using the library from Adafruit, sensor readings can be up to 2 seconds old.
- Comes with a 4.7K or 10K resistor, which you will want to use as a pullup from the data pin to VCC.

→ Specifications:

- Temperature: 0-50°C with $\pm 2^\circ\text{C}$ accuracy
- Moisture: 20-80% with $\pm 5\%$ accuracy
- When the temperature or humidity changes, the sensor's resistance or capacitance changes, which causes a change in the electrical signal.
- The sensor then converts this change into a digital signal that can be read by a microcontroller.

Q3. Is the DHT11 waterproof?

Ans. • The DHT11 provides temperature measurements in Celsius and communicates with the microcontroller

SPPU-TE-COMP-CONTENT – KSKA Git

via the I₂C bus protocol.

- It is covered with a plastic housing so it can be immersed into the water and has a 3m long cable to that flexibility to the entire construction.

Q4. What's the sampling rate of a DHT11 sensor?

Ans The sampling rate of a DHT11 sensor is no more than 1 Hz sampling rate (once every second).

Q5. what is the significance of Adafruit library in this assignment?

Ans The significance of Adafruit library in this assignment:

1. User-friendly library

• Adafruit offers well-documented libraries for various programming environments (like Arduino), which simplify the process of reading data from the DHT11 sensor.

2. Quality hardware:

• Adafruit is known for its high quality components.
• The DHT11 sensor offered by Adafruit is typically reliable and well tested.

3. open-source philosophy:

• Adafruit embraces open-source principles, allowing users to modify and adapt the provided libraries and code to suit their specific needs.

4. Simplified data acquisition:

- The library provides straightforward functions to read temperature and humidity data from the DHT11 sensor, allowing users to easily acquire sensor readings without needing to handle low-level code.
5. Data formatting:
- The library formats the output data (temperature and humidity) in a user-friendly way, making it easier to use in further calculations or display.
